- Introduction of control problem
- Some relevant works
- Main results
- Sketch of the proof
- Applications to BSHJBEs

We consider the following PHJB equation:

$$
\left\{\begin{array}{l}
\partial_{t} V\left(\gamma_{t}\right)+\mathbf{H}\left(\gamma_{t}, V\left(\gamma_{t}\right), \partial_{\times} V\left(\gamma_{t}\right), \partial_{x x} V\left(\gamma_{t}\right)\right)=0,\left(t, \gamma_{t}\right) \in[0, T) \times \Lambda  \tag{1}\\
V\left(\gamma_{T}\right)=\phi\left(\gamma_{T}\right), \quad \gamma_{T} \in \Lambda_{T}
\end{array}\right.
$$

where, for every $\left(t, \gamma_{t}, r, p, I\right) \in[0, T] \times \Lambda \times \mathbb{R} \times \mathbb{R}^{d} \times \Gamma\left(\mathbb{R}^{d}\right)$,

$$
\begin{aligned}
\mathbf{H}\left(\gamma_{t}, r, p, l\right)= & \sup _{u \in U}\left[\left(p, b\left(\gamma_{t}, u\right)\right)_{\mathbb{R}^{d}}+\frac{1}{2} \operatorname{tr}\left[/ \sigma\left(\gamma_{t}, u\right) \sigma^{\top}\left(\gamma_{t}, u\right)\right]\right. \\
& \left.+q\left(\gamma_{t}, r, \sigma^{\top}\left(\gamma_{t}, u\right) p, u\right)\right]
\end{aligned}
$$

Here $\Lambda_{t}:=C\left([0, t] ; \mathbb{R}^{d}\right) ; \Lambda:=\bigcup_{t \in[0, T]} \Lambda_{t} ; \sigma^{\top}$ the transpose of the matrix $\sigma$, $\Gamma\left(\mathbb{R}^{d}\right)$ the set of all $(d \times d)$ symmetric matrices and $(\cdot, \cdot)_{\mathbb{R}^{d}}$ the scalar product of $\mathbb{R}^{d}$. $\gamma_{t}$ is an element of $\Lambda_{t} ; \partial_{t}$ is horizontal derivative, while $\partial_{x}, \partial_{x x}$ are firstand second-order vertical derivatives, respectively (see Dupire (2009)).

The associated controlled equation:

$$
\left\{\begin{align*}
d X^{\gamma_{t}, u}(s) & =b\left(X_{s}^{\gamma_{t}, u}, u(s)\right) d s+\sigma\left(X_{s}^{\gamma_{t}, u}, u(s)\right) d W(s)  \tag{2}\\
X_{t}^{\gamma_{t}, u} & =\gamma_{t} \in \Lambda_{t}
\end{align*}\right.
$$

$\{W(t), t \geq 0\}$ is an $n$-dimensional standard Wiener process; the control process $u$ takes values in some metric space $(U, d)$. We wish to maximize a cost functional of the form:

$$
\begin{equation*}
J\left(\gamma_{t}, u\right):=Y^{\gamma_{t}, u}(t), \quad\left(t, \gamma_{t}\right) \in[0, T] \times \Lambda, \tag{3}
\end{equation*}
$$

over $\mathcal{U}[t, T]$, where the process $Y^{\gamma_{t}, u}$ is defined by BSDE:

$$
\begin{align*}
Y^{\gamma_{t}, u}(s)= & \phi\left(X_{T}^{\gamma_{t}, u}\right)+\int_{s}^{T} q\left(X_{I}^{\gamma_{t}, u}, Y^{\gamma_{t}, u}(I), Z^{\gamma_{t}, u}(I), u(I)\right) d l \\
& -\int_{s}^{T} Z^{\gamma_{t}, u}(I) d W(I), \quad \text { a.s., all } s \in[t, T] . \tag{4}
\end{align*}
$$

We define the value functional of the optimal control problem:

$$
\begin{equation*}
V\left(\gamma_{t}\right):=\operatorname{esssup}_{u(\cdot) \in \mathcal{U}[t, T]} Y^{\gamma_{t}, u}(t), \quad\left(t, \gamma_{t}\right) \in[0, T] \times \Lambda . \tag{5}
\end{equation*}
$$

We will develop a concept of viscosity solutions to PHJB equations on the space of continuous paths and show that the value functional $V$ defined in (5) is unique viscosity solution to the PHJB equation given in (1) when the coefficients $b, \sigma, q$ and $\phi$ only satisfy Lipschitz conditions under maximal norm $\|\cdot\|_{0}$ with respect to the path function.

- the path space $\Lambda_{T}$ is an infinite dimensional Banach space
- the maximal norm $\|\cdot\|_{0}$ is not Gâteaux differentiable

Noticing that the value functional is only Lipschitz continuous under $\|\cdot\|_{0}$ with respect to the path function, the auxiliary functional in the proof of uniqueness should includes the term $\|\cdot\|_{0}^{2 m}$ or a functional which is equivalent to $\|\cdot\|_{0}^{2 m}$. The lack of smoothness of $\|\cdot\|_{0}^{2 m}$ makes it more difficult to define the viscosity solutions and to prove its uniqueness.

HJB equations in finite dimension

A new concept of viscosity solutions
Ekren, Keller, Touzi and Zhang [AP, 2014], Cosso, Federico, Gozzi, Rosestolato, Touzi [AP, 2018] Semi-linear PHJB equations.
Ekren, Touzi and Zhang [AP, 2016a, 2016b], Ekren [SPA,2017], Ren [AAP, 2016] Fully nonlinear case, $\mathbf{H}$ is uniformly nondegenerate.
Ren, Touzi and J. Zhang [SIAM JMA, 2017], Ren, Rosestolato [SIAM JMA, 2020] Degenerate case, $\mathbf{H}$ is $d_{p}$-uniformly continuous.

This new notion is successfully applied to the semilinear case, as this does not require anymore the passage through the maximum principle of Lions (1989).

However, in the nonlinear case, this new notion faces some obstacles, which limit its applications.

Zhou (2021) Viscosity solutions to second order path-dependent Hamilton-Jacobi-Bellman equations and applications, arXiv:2005.05309v2.

We study viscosity solution of PHJB equation in Crandall-Lions framework by defining a smooth functional and applying the Borwein-Preiss variational principle.

## Definition 1

We say $f \in C_{p}^{1,2}\left(\Lambda^{t} ; \mathbb{R}\right)$ for some fixed $t \in[0, T)$ if $f \in C_{p}^{0}\left(\Lambda^{t} ; \mathbb{R}\right)$ and for any $X \in \mathbf{S}_{q}(\mathbb{F})$ for all $q \geq 1$ satisfying $X$ is a continuous semi-martingale on $[s, T] \subset[t, T]$, there exist $\partial_{t} f \in C_{p}^{0}\left(\Lambda^{t} ; \mathbb{R}\right), \partial_{x} f \in C_{p}^{0}\left(\Lambda^{t} ; \mathbb{R}^{d}\right)$ and $\partial_{x x} f \in C_{p}^{0}\left(\Lambda^{t} ; \mathcal{S}\left(\mathbb{R}^{d}\right)\right)$ such that, for any $\hat{s} \in[s, T]$,

$$
\begin{align*}
f\left(X_{\hat{s}}\right)= & f\left(X_{s}\right)+\int_{s}^{\hat{s}} \partial_{t} f\left(X_{l}\right) d I+\frac{1}{2} \int_{s}^{\hat{s}} \partial_{x x} f\left(X_{l}\right) d\langle X\rangle(I) \\
& +\int_{s}^{\hat{s}} \partial_{x} f\left(X_{l}\right) d X(I), P \text {-a.s. } \tag{6}
\end{align*}
$$

We say $f \in C_{p}^{0}\left(\Lambda^{t} ; K\right)$ if $f$ is continuous in $\gamma_{s}$ on $\Lambda^{t}$ under $d_{\infty}$ and grows in a polynomial way.

$$
d_{\infty}\left(\gamma_{s}, \eta_{l}\right):=|s-I|+\sup _{0 \leq \sigma \leq(s \vee I)}\left|\gamma_{s}(s \wedge \sigma)-\eta_{l}(I \wedge \sigma)\right| .
$$

For every $m \in \mathbf{N}^{+}$, define $S_{m}: \Lambda \times \Lambda \rightarrow \mathbb{R}$ by, for every
$\left(t, \gamma_{t}\right),\left(s, \eta_{s}\right) \in[0, T] \times \Lambda$,

$$
S_{m}\left(\gamma_{t}, \eta_{s}\right)= \begin{cases}\frac{\left(\left\|\gamma_{t}-\eta_{s}\right\| \|_{0}^{2 m}-\left|\gamma_{t}(t)-\eta_{s}(s)\right|^{2 m}\right)^{3}}{\left\|\gamma_{t}-\eta_{s}\right\|_{0}^{m m}}, & \left\|\gamma_{t}-\eta_{s}\right\|_{0} \neq 0 ; \\ 0, & \left\|\gamma_{t}-\eta_{s}\right\|_{0}=0 .\end{cases}
$$

For every $M>0$, define $\Upsilon^{m, M}$ and $\bar{\Upsilon}^{m, M}$ by

$$
\begin{aligned}
\Upsilon^{m, M}\left(\gamma_{t}, \eta_{s}\right) & =S_{m}\left(\gamma_{t}, \eta_{s}\right)+M\left|\gamma_{t}(t)-\eta_{s}(s)\right|^{2 m}, \\
\bar{\Upsilon}^{m, M}\left(\gamma_{t}, \eta_{s}\right) & =\Upsilon^{m, M}\left(\gamma_{t}, \eta_{s}\right)+|s-t|^{2} .
\end{aligned}
$$

## Lemma 2

For every fixed $\left(\hat{t}, a_{\hat{t}}\right) \in[0, T) \times \Lambda_{\hat{t}}$, define $S_{m}^{a_{\hat{t}}}: \Lambda^{\hat{t}} \rightarrow R$ by

$$
S_{m}^{a_{\hat{t}}}\left(\gamma_{t}\right):=S_{m}\left(\gamma_{t}, a_{\hat{t}}\right), \quad\left(t, \gamma_{t}\right) \in[\hat{t}, T] \times \Lambda^{\hat{t}}
$$

Then $S_{m}^{a_{\hat{t}}}(\cdot) \in C_{p}^{1,2}\left(\Lambda^{\hat{t}}\right)$. Moreover, for every $M \geq 3$,

$$
\begin{equation*}
\left\|\gamma_{t}\right\|_{0}^{2 m} \leq \Upsilon^{m, M}\left(\gamma_{t}\right) \leq M\left\|\gamma_{t}\right\|_{0}^{2 m}, \quad\left(t, \gamma_{t}\right) \in[0, T] \times \Lambda . \tag{7}
\end{equation*}
$$

Since $\left\|\gamma_{t}-a_{t}\right\|_{0}^{6}$ does not belong to $C_{p}^{1,2}\left(\Lambda^{\hat{t}}\right)$, it cannot appear as an auxiliary functional in the proof of the uniqueness and stability of viscosity solutions. However, by the this Lemma, we can replace $\left\|\gamma_{t}-a_{\hat{t}}\right\|_{0}^{6}$ with its equivalent functional $\Upsilon^{3,3}\left(\gamma_{t}, a_{\hat{t}}\right) \in C_{p}^{1,2}\left(\Lambda^{\hat{t}}\right)$.
Let $\Upsilon^{m, M}\left(\gamma_{t}\right)$ denote $\Upsilon^{m, M}\left(\gamma_{t}, \mathbf{0}\right)$. Let $S, \Upsilon$ and $\bar{\Upsilon}$ denote $S_{3}, \Upsilon^{3,3}$ and $\bar{\Upsilon}^{3,3}$, respectively.

We can give the concrete expression of the pathwise derivatives.

$$
\begin{gathered}
\partial_{t} S_{m}^{a_{\hat{t}}}\left(\gamma_{t}\right)=0 . \\
= \begin{cases}-\frac{6 m\left(\left\|\gamma_{t}-a_{t}\right\|_{0}^{2 m}-\left|\gamma_{t}(t)-a_{\hat{t}}(\hat{t})\right|^{2 m}\right)^{2}\left|\gamma_{t}(t)-a_{\hat{t}}(\hat{t})\right|^{2 m-2}\left(\left(\gamma_{t}\right)_{i}(t)-\left(a_{\hat{t}}\right)_{i}(\hat{t})\right)}{\left\|\gamma_{t}-a_{t}\right\|_{0}^{4 m}}, & \left\|\gamma_{t}-a_{\hat{t}}\right\|_{0} \neq 0, \\
0, & \left\|\gamma_{t}-a_{\hat{t}}\right\|_{0}=0 .\end{cases}
\end{gathered}
$$

$$
\begin{aligned}
& \partial_{x_{j} x_{i}} S_{m}^{a_{\hat{t}}}\left(\gamma_{t}\right) \\
& \int \frac{24 m^{2}\left(\left\|\gamma_{t}-a_{\hat{t}}\right\|_{0}^{2 m}-\left|\gamma_{t}(t)-a_{\hat{t}}(\hat{t})\right|^{2 m}\right)\left|\gamma_{t}(t)-a_{\hat{t}}(\hat{t})\right|^{4 m-4}\left(\left(\gamma_{t}\right)_{i}(t)-\left(a_{\hat{t}}\right) i(\hat{t})\right)}{\left\|\gamma_{t}-a_{\hat{t}}\right\|_{0}^{4 m}} \\
& \times\left(\left(\gamma_{t}\right)_{j}(t)-\left(a_{\hat{t}}\right)_{j}(\hat{t})\right)-\frac{12 m(m-1)\left(\left\|\gamma_{t}-a_{\hat{t}}\right\|_{0}^{2 m}-\left|\gamma_{t}(t)-a_{\hat{t}}(\hat{t})\right|^{2 m}\right)^{2}}{\left\|\gamma_{t}-a_{\hat{t}}\right\|_{0}^{4}} \\
& =\left\{\times\left|\gamma_{t}(t)-a_{\hat{t}}(\hat{t})\right|^{2 m-4}\left(\left(\gamma_{t}\right)_{i}(t)-\left(a_{\hat{t}}\right)_{i}(\hat{t})\right)\left(\left(\gamma_{t}\right)_{j}(t)-\left(a_{\hat{t}}\right)_{j}(\hat{t})\right)\right. \\
& -\frac{6 m\left(\left\|\gamma_{t}-a_{\hat{t}}\right\|_{0}^{2 m}-\left|\gamma_{t}(t)-a_{\hat{t}}(\hat{t})\right|^{2 m}\right)^{2}\left|\gamma_{t}(t)-a_{\hat{t}}(\hat{t})\right|^{2 m-2} \mathbf{1}_{\{i=j\}}}{\left\|\gamma_{t}-a_{\hat{t}}\right\|_{0}^{4 m}}, \\
& \left\|\gamma_{t}-a_{\hat{t}}\right\|_{0} \neq 0, \\
& 0, \\
& \left\|\gamma_{t}-a_{\hat{t}}\right\|_{0}=0 .
\end{aligned}
$$

In the proof of uniqueness of viscosity solutions, we also need the following lemma.

## Lemma 3

For $m \in \mathbf{N}^{+}$and $M \geq 3$, we have that, for every $\left(t, \gamma_{t}\right),\left(t, \gamma_{t}^{\prime}\right) \in[0, T] \times \hat{\Lambda}$,

$$
\begin{equation*}
\left(\Upsilon^{m, M}\left(\gamma_{t}+\gamma_{t}^{\prime}\right)\right)^{\frac{1}{2 m}} \leq\left(\Upsilon^{m, M}\left(\gamma_{t}\right)\right)^{\frac{1}{2 m}}+\left(\Upsilon^{m, M}\left(\gamma_{t}^{\prime}\right)\right)^{\frac{1}{2 m}} \tag{8}
\end{equation*}
$$

In particular, $\left(\Lambda_{T},\left(\Upsilon^{m, M}(\cdot)\right)^{\frac{1}{2 m}}\right)$ is a Banach space.

Let's solve the first main difficulty. We want to find the maximum point of functional $f$ defined on $\left(\Lambda^{t}, d_{\infty}\right)$.

## Definition 4

Let $t \in[0, T]$ be fixed. We say that a continuous functional $\rho: \Lambda^{t} \times \Lambda^{t} \rightarrow[0,+\infty)$ is a gauge-type function provided that:
(i) $\rho\left(\gamma_{s}, \gamma_{s}\right)=0$ for all $\left(s, \gamma_{s}\right) \in[t, T] \times \Lambda^{t}$,
(ii) for any $\varepsilon>0$, there exists $\delta>0$ such that, for all $\gamma_{s}, \eta_{I} \in \Lambda^{t}$, we have $\rho\left(\gamma_{s}, \eta_{I}\right) \leq \delta$ implies that $d_{\infty}\left(\gamma_{s}, \eta_{I}\right)<\varepsilon$.

It follows from (7) that $\bar{\Upsilon}^{m, M}$ is a gauge-type function.

$$
\begin{equation*}
\left\|\gamma_{t}\right\|_{0}^{2 m} \leq \Upsilon^{m, M}\left(\gamma_{t}\right) \leq M\left\|\gamma_{t}\right\|_{0}^{2 m}, \quad\left(t, \gamma_{t}\right) \in[0, T] \times \Lambda \tag{7}
\end{equation*}
$$

## Lemma 5 [Borwein, Zhu (2005) Techniques of variational analysis]

Let $t \in[0, T]$ be fixed and let $f: \Lambda^{t} \rightarrow \mathbb{R}$ be an upper semicontinuous functional bounded from above. Suppose that $\rho$ is a gauge-type function and $\left\{\delta_{i}\right\}_{i \geq 0}$ is a sequence of positive number, and suppose that $\varepsilon>0$ and $\left(t_{0}, \gamma_{t_{0}}^{0}\right) \in[t, T] \times \Lambda^{t}$ satisfy

$$
f\left(\gamma_{t_{0}}^{0}\right) \geq \sup _{\left(s, \gamma_{s}\right) \in[t, T] \times \Lambda^{t}} f\left(\gamma_{s}\right)-\varepsilon
$$

Then there exist $\left(\hat{t}, \hat{\gamma}_{\hat{t}}\right) \in[t, T] \times \Lambda^{t}$ and a sequence $\left\{\left(t_{i}, \gamma_{t_{i}}^{i}\right)\right\}_{i \geq 1} \subset[t, T] \times \Lambda^{t}$ such that
(i) $\rho\left(\gamma_{t_{0}}^{0}, \hat{\gamma}_{\hat{t}}\right) \leq \frac{\varepsilon}{\delta_{0}}, \rho\left(\gamma_{t_{i}}^{i}, \hat{\gamma}_{\hat{t}}\right) \leq \frac{\varepsilon}{2^{i} \delta_{0}}$ and $t_{i} \uparrow \hat{t}$ as $i \rightarrow \infty$,
(ii) $f\left(\hat{\gamma}_{\hat{t}}\right)-\sum_{i=0}^{\infty} \delta_{i} \rho\left(\gamma_{t_{i}}^{i}, \hat{\gamma}_{\hat{t}}\right) \geq f\left(\gamma_{t_{0}}^{0}\right)$, and
(iii) $f\left(\gamma_{s}\right)-\sum_{i=0}^{\infty} \delta_{i} \rho\left(\gamma_{t_{i}}^{i}, \gamma_{s}\right)<f\left(\hat{\gamma}_{\hat{t}}\right)-\sum_{i=0}^{\infty} \delta_{i} \rho\left(\gamma_{t_{i}}^{i}, \hat{\gamma}_{\hat{t}}\right)$ for all
$\left(s, \gamma_{s}\right) \in[\hat{t}, T] \times \Lambda^{\hat{t}} \backslash\left\{\left(\hat{t}, \hat{\gamma}_{\hat{t}}\right)\right\}$.

We can apply $\bar{\Upsilon}^{m, M}$ to this Lemma to get a maximum of a perturbation of the auxiliary functional in the proof of uniqueness.

For every $\left(t, \gamma_{t}\right) \in[0, T] \times \Lambda$ and $w \in C^{0}(\Lambda)$, define

$$
\begin{aligned}
& \mathcal{A}^{+}\left(\gamma_{t}, w\right)=\left\{\varphi \in C_{p}^{1,2}\left(\Lambda^{t}\right): 0=(w-\varphi)\left(\gamma_{t}\right)=\sup _{\left(s, \eta_{s}\right) \in[t, T] \times \Lambda}(w-\varphi)\left(\eta_{s}\right)\right\}, \\
& \mathcal{A}^{-}\left(\gamma_{t}, w\right)=\left\{\varphi \in C_{p}^{1,2}\left(\Lambda^{t}\right): 0=(w+\varphi)\left(\gamma_{t}\right)=\inf _{\left(s, \eta_{s}\right) \in[t, T] \times \Lambda}(w+\varphi)\left(\eta_{s}\right)\right\} .
\end{aligned}
$$

## Definition 6

$w \in C^{0}(\Lambda)$ is called a viscosity subsolution (resp., supersolution) to (1) if the terminal condition, $w\left(\gamma_{T}\right) \leq \phi\left(\gamma_{T}\right)$ (resp., $\left.w\left(\gamma_{T}\right) \geq \phi\left(\gamma_{T}\right)\right)$ for all $\gamma_{T} \in \Lambda_{T}$ is satisfied, and whenever $\varphi \in \mathcal{A}^{+}\left(\gamma_{s}, w\right)\left(r e s p ., \varphi \in \mathcal{A}^{-}\left(\gamma_{s}, w\right)\right)$ with $\left(s, \gamma_{s}\right) \in[0, T) \times \Lambda$, we have

$$
\partial_{t} \varphi\left(\gamma_{s}\right)+\mathbf{H}\left(\gamma_{s}, \varphi\left(\gamma_{s}\right), \partial_{x} \varphi\left(\gamma_{s}\right), \partial_{x x} \varphi\left(\gamma_{s}\right)\right) \geq 0
$$

(resp., $\left.-\partial_{t} \varphi\left(\gamma_{s}\right)+\mathbf{H}\left(\gamma_{s},-\varphi\left(\gamma_{s}\right),-\partial_{x} \varphi\left(\gamma_{s}\right),-\partial_{x x} \varphi\left(\gamma_{s}\right)\right) \leq 0\right)$.
$w \in C^{0}(\Lambda)$ is said to be a viscosity solution to equation (1) if it is both a viscosity subsolution and a viscosity supersolution.

## Hypothesis 7

$b: \Lambda \times U \rightarrow R^{d}, \sigma: \Lambda \times U \rightarrow R^{d \times n} q: \Lambda \times R \times R^{d} \times U \rightarrow R$ and $\phi: \Lambda_{T} \rightarrow R$ are continuous, and there exists a constant $L>0$ such that, for all $\left(t, \gamma_{t}, \eta_{T}, y, z, u\right)$,

$$
\begin{aligned}
& \left(t, \gamma_{t}^{\prime}, \eta_{T}^{\prime}, y^{\prime}, z^{\prime}, u\right) \in[0, T] \times \Lambda \times \Lambda_{T} \times R \times \equiv \times U \\
& \quad\left|b\left(\gamma_{t}, u\right)\right|^{2} \vee\left|\sigma\left(\gamma_{t}, u\right)\right|^{2} \leq L^{2}\left(1+\left\|\gamma_{t}\right\|_{0}^{2}\right) \\
& \quad\left|b\left(\gamma_{t}, u\right)-b\left(\gamma_{t}^{\prime}, u\right)\right| \vee\left|\sigma\left(\gamma_{t}, u\right)-\sigma\left(\gamma_{t}^{\prime}, u\right)\right| \leq L\left\|\gamma_{t}-\gamma_{t}^{\prime}\right\|_{0}
\end{aligned}
$$

$$
\left|q\left(\gamma_{t}, y, z, u\right)\right| \leq L\left(1+\left\|\gamma_{t}\right\|_{0}+|y|+|z|\right)
$$

$$
\left|q\left(\gamma_{t}, y, z, u\right)-q\left(\gamma_{t}^{\prime}, y^{\prime}, z^{\prime}, u\right)\right|
$$

$$
\leq L\left(| | \gamma_{t}-\gamma_{t}^{\prime} \|_{0}+\left|y-y^{\prime}\right|+\left|z-z^{\prime}\right|\right)
$$

$$
\left|\phi\left(\eta_{T}\right)-\phi\left(\eta_{T}^{\prime}\right)\right| \leq L\left\|\eta_{T}-\eta_{T}^{\prime}\right\|_{0} .
$$

By functional Itô formula and dynamic programming principle (DPP), we get that

## Theorem 8

Suppose that Hypothesis 7 holds. Then the value functional $V$ defined by (5) is a viscosity solution to equation (1).

We also have the result of classical solutions, which show the consistency of viscosity solutions.

## Theorem 9

Let $V$ denote the value functional defined by (5). If $V \in C_{p}^{1,2}(\Lambda)$, then $V$ is a classical solution of (1).

## Theorem 10

Let $\kappa>0$. Let $w_{1}, w_{2}: \Lambda \rightarrow \mathbb{R}$ be upper semicontinuous functions bounded from above and such that

$$
\limsup _{\left\|\gamma_{t}\right\|_{0} \rightarrow \infty} \frac{w_{1}\left(\gamma_{t}\right)}{\left\|\gamma_{t}\right\|_{0}}<0 ; \quad \limsup _{\left\|\gamma_{t}\right\|_{0} \rightarrow \infty} \frac{w_{2}\left(\gamma_{t}\right)}{\left\|\gamma_{t}\right\|_{0}}<0
$$

Let $\varphi \in C^{2}\left(\mathbb{R}^{d} \times \mathbb{R}^{d}\right)$ be such that

$$
w_{1}\left(\gamma_{t}\right)+w_{2}\left(\eta_{t}\right)-\varphi\left(\gamma_{t}(t), \eta_{t}(t)\right)
$$

has a maximum over $\Lambda^{\hat{t}} \otimes \Lambda^{\hat{t}}$ at a point $\left(\hat{\gamma}_{\hat{t}}, \hat{\eta}_{\hat{t}}\right)$ with $\hat{t} \in(0, T)$, where $\Lambda^{t} \otimes \Lambda^{t}:=\left\{\left(\gamma_{s}, \eta_{s}\right) \mid \gamma_{s}, \eta_{s} \in \Lambda^{t}\right\}$ for all $t \in[0, T]$. Assume, moreover, $\tilde{w}_{1}^{\hat{t}, *} \in \Phi\left(\hat{t}, \hat{\gamma}_{\hat{t}}(\hat{t})\right)$ and $\tilde{w}_{2}^{\hat{t}, *} \in \Phi\left(\hat{t}, \hat{\eta}_{\hat{t}}(\hat{t})\right)$, and there exists a local modulus of continuity $\rho_{1}$ such that, for all $\hat{t} \leq t \leq s \leq T, \gamma_{t} \in \Lambda, i=1,2$,

$$
w_{i}\left(\gamma_{t}\right)-w_{i}\left(\gamma_{t, s}\right) \leq \rho_{1}\left(|s-t|,\left\|\gamma_{t}\right\|_{0}\right) .
$$

## Theorem 10 (Continued)

Then there exist the sequences $\left(t_{k}, \gamma_{t_{k}}^{k}\right),\left(s_{k}, \eta_{s_{k}}^{k}\right) \in[\hat{t}, T] \times \Lambda^{\hat{t}}$ and the sequences of functionals $\varphi_{k} \in C_{p}^{1,2}\left(\Lambda^{t_{k}}\right), \psi_{k} \in C_{p}^{1,2}\left(\Lambda^{s_{k}}\right)$ such that $\varphi_{k}, \partial_{t} \varphi_{k}, \partial_{x} \varphi_{k}, \partial_{x x} \varphi_{k}, \psi_{k}, \partial_{t} \psi_{k}, \partial_{x} \psi_{k}, \partial_{x x} \psi_{k}$ are bounded and uniformly continuous, and such that

$$
w_{1}\left(\gamma_{t}\right)-\varphi_{k}\left(\gamma_{t}\right)
$$

has a strict global maximum 0 at $\gamma_{t_{k}}^{k}$ over $\Lambda^{t_{k}}$,

$$
w_{2}\left(\eta_{t}\right)-\psi_{k}\left(\eta_{t}\right)
$$

has a strict global maximum 0 at $\eta_{s_{k}}^{k}$ over $\Lambda^{s_{k}}$, and

$$
\begin{aligned}
& \left(t_{k}, \gamma_{t_{k}}^{k}\left(t_{k}\right), w_{1}\left(\gamma_{t_{k}}^{k}\right), \partial_{t} \varphi_{k}\left(\gamma_{t_{k}}^{k}\right), \partial_{x} \varphi_{k}\left(\gamma_{t_{k}}^{k}\right), \partial_{x x} \varphi_{k}\left(\gamma_{t_{k}}^{k}\right)\right) \\
& \xrightarrow{k \rightarrow \infty}\left(\hat{t}, \hat{\gamma}_{\hat{t}}(\hat{t}), w_{1}\left(\hat{\gamma}_{\hat{t}}\right), b_{1}, \nabla_{x_{1}} \varphi\left(\hat{\gamma}_{\hat{t}}(\hat{t}), \hat{\eta}_{\hat{t}}(\hat{t})\right), x\right),
\end{aligned}
$$

## Theorem 10 (Continued)

$$
\begin{aligned}
& \left(s_{k}, \eta_{s_{k}}^{k}\left(s_{k}\right), w_{2}\left(\eta_{s_{k}}^{k}\right), \partial_{t} \psi_{k}\left(\eta_{s_{k}}^{k}\right), \partial_{x} \psi_{k}\left(\eta_{s_{k}}^{k}\right), \partial_{x x} \psi_{k}\left(\eta_{s_{k}}^{k}\right)\right) \\
& \xrightarrow{k \rightarrow \infty}\left(\hat{t}, \hat{\eta}_{\hat{t}}(\hat{t}), w_{2}\left(\hat{\eta}_{\hat{t}}(\hat{t})\right), b_{2}, \nabla_{x_{2}} \varphi\left(\hat{\gamma}_{\hat{t}}(\hat{t}), \hat{\eta}_{\hat{t}}(\hat{t})\right), Y\right),
\end{aligned}
$$

where $b_{1}+b_{2}=0$ and $X, Y \in \mathcal{S}\left(\mathbb{R}^{d}\right)$ satisfy the following inequality:

$$
-\left(\frac{1}{\kappa}+|A|\right) I \leq\left(\begin{array}{cc}
X & 0 \\
0 & Y
\end{array}\right) \leq A+\kappa A^{2}
$$

and $A=\nabla_{x}^{2} \varphi\left(\hat{\gamma}_{\hat{t}}(\hat{t}), \hat{\eta}_{\hat{t}}(\hat{t})\right)$. Here $\nabla_{x_{1}} \varphi$ and $\nabla_{x_{2}} \varphi$ denote the standard first order derivative of $\varphi$ with respect to the first variable and the second variable, respectively.

By Crandall-Ishii maximum principle and Borwein-Preiss variational principle, we get that

## Theorem 11

Suppose Hypothesis 7 holds. Let $W_{1} \in C^{0}(\Lambda)$ (resp., $\left.W_{2} \in C^{0}(\Lambda)\right)$ be a viscosity subsolution (resp., supersolution) to equation (1) and let there exist constant $L>0$ such that, for any $\left(t, \gamma_{t}\right),\left(s, \eta_{s}\right) \in[0, T] \times \Lambda$,

$$
\begin{align*}
& \left|W_{1}\left(\gamma_{t}\right)\right| \vee\left|W_{2}\left(\gamma_{t}\right)\right| \leq L\left(1+\left\|\gamma_{t}\right\|_{0}\right)  \tag{9}\\
& \left|W_{1}\left(\gamma_{t}\right)-W_{1}\left(\eta_{s}\right)\right| \vee\left|W_{2}\left(\gamma_{t}\right)-W_{2}\left(\eta_{s}\right)\right| \\
\leq & L\left(1+\left\|\gamma_{t}\right\|_{0}+\left\|\eta_{s}\right\|_{0}\right)|s-t|^{\frac{1}{2}}+L\left\|\gamma_{t}-\eta_{s}\right\|_{0} \tag{10}
\end{align*}
$$

Then $W_{1} \leq W_{2}$.

By existence theorem and comparison theorem we get that

## Theorem 12

Let Hypothesis 7 hold. Then the value functional $V$ defined by (5) is the unique viscosity solution to (1) in the class of functionals satisfying (9) and (10).

Step 1. Definitions of the auxiliary functions.
We assume the converse result that $\left(\tilde{t}, \tilde{\gamma}_{\tilde{t}}\right) \in[T-\bar{a}, T) \times \Lambda$ exists such that $\tilde{m}:=W_{1}\left(\tilde{\gamma}_{\tilde{t}}\right)-W_{2}\left(\tilde{\gamma}_{\tilde{t}}\right)>0$.
We define for any $\left(t, \gamma_{t}, \eta_{t}\right) \in(T-\bar{a}, T] \times \Lambda \times \Lambda$,

$$
\begin{aligned}
\Psi\left(\gamma_{t}, \eta_{t}\right)= & W_{1}\left(\gamma_{t}\right)-W_{2}\left(\eta_{t}\right)-\beta \Upsilon\left(\gamma_{t}, \eta_{t}\right)-\beta^{\frac{1}{3}}\left|\gamma_{t}(t)-\eta_{t}(t)\right|^{2} \\
& -\varepsilon \frac{\nu T-t}{\nu T}\left(\Upsilon\left(\gamma_{t}\right)+\Upsilon\left(\eta_{t}\right)\right) .
\end{aligned}
$$

From Lemma 5 it follows that, for every

$$
\begin{aligned}
& \left(t_{0}, \gamma_{t_{0}}^{0}, \eta_{t_{0}}^{0}\right) \in[\tilde{t}, T] \times \Lambda^{\tilde{t}} \times \Lambda^{\tilde{t}} \text { satisfy } \\
& \quad \Psi\left(\gamma_{t_{0}}^{0}, \eta_{t_{0}}^{0}\right) \geq \sup _{\left(s, \gamma_{s}, \eta_{s}\right) \in[\tilde{t}, T] \times \Lambda^{\tilde{t}} \times \Lambda^{\tilde{t}}} \Psi\left(\gamma_{s}, \eta_{s}\right)-\frac{1}{\beta},
\end{aligned}
$$

there exist $\left(\hat{t}, \hat{\gamma}_{\hat{t}}, \hat{\eta}_{\hat{t}}\right) \in[\tilde{t}, T] \times \Lambda^{\tilde{t}} \times \Lambda^{\tilde{t}}$ and a sequence $\left\{\left(t_{i}, \gamma_{t_{i}}^{i}, \eta_{t_{i}}^{i}\right)\right\}_{i \geq 1} \subset[\tilde{t}, T] \times \Lambda^{\tilde{t}} \times \Lambda^{\tilde{t}}$ such that for all $\left(s, \gamma_{s}, \eta_{s}\right) \in[\hat{t}, T] \times \Lambda^{\hat{t}} \times \Lambda^{\hat{t}} \backslash\left\{\left(\hat{t}, \hat{\gamma}_{\hat{t}}, \hat{\eta}_{\hat{t}}\right)\right\}$,

$$
\Psi_{1}\left(\gamma_{s}, \eta_{s}\right)<\Psi_{1}\left(\hat{\gamma}_{\hat{t}}, \hat{\eta}_{\hat{t}}\right)
$$

where

$$
\Psi_{1}\left(\gamma_{t}, \eta_{t}\right):=\Psi\left(\gamma_{t}, \eta_{t}\right)-\sum_{i=0}^{\infty} \frac{1}{2^{i}}\left[\Upsilon\left(\gamma_{t_{i}}^{i}, \gamma_{t}\right)+\Upsilon\left(\eta_{t_{i}}^{i}, \eta_{t}\right)+\left|s-t_{i}\right|^{2}\right] .
$$

Step 2. There exists $M_{0}>0$ independent of $\beta$ such that

$$
\begin{equation*}
\left\|\hat{\gamma}_{\hat{t}}\right\|_{0} \vee\left\|\hat{\eta}_{\hat{t}}\right\|_{0}<M_{0}, \tag{11}
\end{equation*}
$$

and the following result holds true:

$$
\beta\left\|\hat{\gamma}_{\hat{t}}-\hat{\eta}_{\hat{t}}\right\|_{0}^{6}+\beta\left|\hat{\gamma}_{\hat{t}}(\hat{t})-\hat{\eta}_{\hat{t}}(\hat{t})\right|^{4} \rightarrow 0 \text { as } \beta \rightarrow \infty .
$$

Step 3. There exists $N>0$ such that $\hat{t} \in(T-\bar{a}, T)$ for all $\beta \geq N$.

Step 4. Maximum principle.
We put, for $\left(t, \gamma_{t}, \eta_{t}\right) \in(T-\bar{a}, T] \times \Lambda \times \Lambda$,

$$
\begin{aligned}
w_{1}\left(\gamma_{t}\right)= & W_{1}\left(\gamma_{t}\right)-2^{5} \beta \Upsilon\left(\gamma_{t}, \hat{\xi}_{\hat{t}}\right)-\varepsilon \frac{\nu T-t}{\nu T} \Upsilon\left(\gamma_{t}\right)-\varepsilon \bar{\Upsilon}\left(\gamma_{t}, \hat{\gamma}_{\hat{t}}\right) \\
& -\sum_{i=0}^{\infty} \frac{1}{2^{i}} \bar{\Upsilon}\left(\gamma_{t_{i}}^{i}, \gamma_{t}\right) \\
w_{2}\left(\eta_{t}\right)= & -W_{2}\left(\eta_{t}\right)-2^{5} \beta \Upsilon\left(\eta_{t}, \hat{\xi}_{\hat{t}}\right)-\varepsilon \frac{\nu T-t}{\nu T} \Upsilon\left(\eta_{t}\right)-\varepsilon \bar{\Upsilon}\left(\eta_{t}, \hat{\eta}_{\hat{t}}\right) \\
& -\sum_{i=0}^{\infty} \frac{1}{2^{i}} \Upsilon\left(\eta_{t_{i}}^{i}, \eta_{t}\right)
\end{aligned}
$$

where $\hat{\xi}_{\hat{t}}=\frac{\hat{\gamma}_{\hat{t}}+\hat{\eta}_{\hat{t}}}{2}$.

Step 5. Calculation and completion of the proof.
By a simple calculation, we can let $\beta>0$ be large enough such that

$$
\begin{aligned}
c \leq & -\frac{\varepsilon}{\nu T}\left(\Upsilon\left(\hat{\gamma}_{\hat{t}}\right)+\Upsilon\left(\hat{\eta}_{\hat{t}}\right)\right) \\
& +\varepsilon \frac{\nu T-\hat{t}}{\nu T}(342 L+36) L\left(1+\left\|\hat{\gamma}_{\hat{t}}\right\|_{0}^{6}+\left\|\hat{\eta}_{\hat{t}}\right\|_{0}^{6}\right)+\frac{c}{4} .
\end{aligned}
$$

Recalling $\nu=1+\frac{1}{2 T(342 L+36) L}$ and $\bar{a}=\frac{1}{2(342 L+36) L} \wedge T$, the following contradiction is induced:

$$
c \leq \frac{\varepsilon}{\nu T}+\frac{c}{4} \leq \frac{c}{2}
$$

$$
\left\{\begin{array}{l}
d \bar{V}(t, x)=-\sup _{u \in U}\left[\left(\nabla_{x} \bar{V}(t, x), b\left(W_{t}, x, u\right)\right)_{\mathbb{R}^{d}}\right. \\
+\frac{1}{2} \operatorname{tr}\left(\nabla_{x}^{2} \bar{V}(t, x) \bar{\sigma}\left(W_{t}, x, u\right) \bar{\sigma}^{\top}\left(W_{t}, x, u\right)\right) \\
+\operatorname{tr}\left(\bar{\sigma}^{\top}\left(W_{t}, x, u\right) \nabla_{x} p(t, x)\right)+\bar{q}\left(W_{t}, x\right) \bar{V}(t, x), p(t, x) \\
\left.\left.+\bar{\sigma}^{\top}\left(W_{t}, x, u\right) \nabla_{x} \bar{V}(t, x), u\right)\right]+p(t, x) d W(t),(t, x) \in[0, T] \times \mathbb{R}^{m}, \\
\bar{V}(T, x)=\bar{\phi}\left(W_{T}, x\right), \quad x \in \mathbb{R}^{m}, \quad P \text {-a.s. } \tag{12}
\end{array}\right.
$$

Define the pair of $\mathcal{F}_{t}$-adapted processes

$$
(\bar{V}(t, x), p(t, x)):=\left(V\left(W_{t}, x\right), \partial_{\gamma} V\left(W_{t}, x\right)\right), \quad(t, x) \in[0, T] \times \mathbb{R}^{m},(13)
$$

## Theorem 13

Let $b, \sigma, q, \phi$ satisfy Hypothesis 7 . Then the $\mathcal{F}_{t}$-adapted process $\bar{V}(t, x):=V\left(W_{t}, x\right)$ defined by (13) is a unique viscosity solution to BSHJB equation (12).
