• If FBSDE (3) admits an adapted solution (X, Y, Z), then by choosing y = Y(0) and $\bar{u}(\cdot) = Z(\cdot)$,

$$J(0, x, Y(0); \bar{u}(\cdot)) = |Y(T) - g(X(T))|^2 = V(0, x, y) = 0.$$

• If Problem (C) admits an optimal triple $(\bar{X}(\cdot), \bar{Y}(\cdot), \bar{u}(\cdot))$ for some (0, x, y) with

$$V(0, x, y) = 0,$$
 (9)

then $(\bar{X}(\cdot), \bar{Y}(\cdot), \bar{u}(\cdot))$ is an adapted solution of FBSDE (3).

• If FBSDE (3) admits an adapted solution (X, Y, Z), then by choosing y = Y(0) and $\bar{u}(\cdot) = Z(\cdot)$,

$$J(0, x, Y(0); \bar{u}(\cdot)) = |Y(T) - g(X(T))|^2 = V(0, x, y) = 0.$$

• If Problem (C) admits an optimal triple $(\bar{X}(\cdot), \bar{Y}(\cdot), \bar{u}(\cdot))$ for some (0, x, y) with

$$V(0, x, y) = 0,$$
 (9)

then $(\bar{X}(\cdot), \bar{Y}(\cdot), \bar{u}(\cdot))$ is an adapted solution of FBSDE (3).

Proposition (Ma-Y). FBSDE (3) is globally solvable if and only if Problem (C) admits an optimal control at some (0, x, y) which is a **nodal point** of $V(\cdot, \cdot, \cdot)$.

For Problem (C), $V(\cdot, \cdot, \cdot)$ satisfies the HJB equation:

$$\begin{cases} V_t(t, x, y) + H(t, x, y, V_x, V_y, V_{xx}, V_{xy}, V_{yy}) = 0, \\ (t, x, y) \in [0, T] \times \mathbb{R}^n \times \mathbb{R}^m, \\ V(T, x, y) = |y - g(x)|^2, \quad (x, y) \in \mathbb{R}^n \times \mathbb{R}^m, \end{cases}$$
(10)

where the Hamiltonian H is given by the following:

$$\begin{aligned} H(t, x, y, V_x, V_y, V_{xx}, V_{xy}, V_{yy}) \\ &= \inf_{u \in \mathbb{R}^{m \times d}} \Big\{ \langle V_x, b(x, y, u) \rangle + \langle V_y, \widehat{b}(x, y, u) \rangle \\ &+ \frac{1}{2} \mathrm{tr} \left[\sigma(x, y, u) \sigma(x, y, u)^\top V_{xx} \right] \\ &+ \mathrm{tr} \left[\sigma(x, y, u) \widehat{\sigma}(x, y, u)^\top V_{xy} \right] \\ &+ \frac{1}{2} \mathrm{tr} \left[\widehat{\sigma}(x, y, u) \widehat{\sigma}(x, y, u)^\top V_{yy} \right] \Big\}. \end{aligned}$$

▲□▶▲圖▶▲≧▶▲≧▶ ≧ のへぐ

Consider the following FBSDE:

$$\begin{cases} X(t) = x + \int_0^t b(X(s), Y(s)) ds + \int_0^t \sigma(X(s), Y(s)) dW(s), \\ Y(t) = g(X(T)) + \int_t^T \widehat{b}(X(s), Y(s)) ds \\ + \int_t^T \widehat{\sigma}(X(s), Y(s), Z(s)) dW(s). \end{cases}$$
(11)

This is equivalent to the following:

$$\begin{cases} X(t) = x + \int_0^t b(X(s), Y(s)) ds + \int_0^t \sigma(X(s), Y(s)) dW(s), \\ Y(t) = \mathbb{E} \Big[g(X(T)) + \int_t^T \widehat{b}(X(s), Y(s)) ds \mid \mathcal{F}_t \Big]. \end{cases}$$
(12)

This is comparable with the equation studied by Antonelli.

Theorem (Ma–Y). Under proper conditions, including $\sigma(x, y)\sigma(x, y)^{\top} \ge \nu > 0, \qquad \forall (x, y) \in \mathbb{R}^{n+m},$

and

$$\widehat{\sigma}(x, y, \mathbb{R}^{m \times d}) = \mathbb{R}^{m \times d}, \tag{13}$$

for any T > 0 and $x \in \mathbb{R}$, FBSDE (11) is solvable.
Theorem (Ma–Y). Under proper conditions, including $\sigma(x, y)\sigma(x, y)^{\top} \ge \nu > 0, \qquad \forall (x, y) \in \mathbb{R}^{n+m},$

and

$$\widehat{\sigma}(x, y, \mathbb{R}^{m \times d}) = \mathbb{R}^{m \times d}, \tag{13}$$

for any T > 0 and $x \in \mathbb{R}$, FBSDE (11) is solvable.

Our paper was completed in the early 1993, which was listed as #1117 in the IMA preprint series.

3. The Four-Step Scheme

3. The Four-Step Scheme

Invariant Embedding (Decoupling)

3. The Four-Step Scheme

Invariant Embedding (Decoupling)

In solving LQ problem, one faces to the following:

$$\begin{cases} \dot{\bar{x}}(t) = A\bar{x}(t) + B\bar{u}(t), \\ \dot{\bar{y}}(t) = -A^{\top}\bar{y}(t) - Q\bar{x}(t), \\ \bar{x}(0) = x_0, \qquad \bar{y}(T) = G\bar{x}(T), \end{cases}$$

with

$$R\overline{u}(t) + B^{ op}\overline{x}(t) = 0.$$

Then, we obtain the following coupled system:

$$\begin{cases} \dot{\bar{x}}(t) = A\bar{x}(t) - BR^{-1}B^{\top}\bar{y}(t), \\ \dot{\bar{y}}(t) = -A^{\top}\bar{y}(t) - Q\bar{x}(t), \\ \bar{x}(0) = x_0, \qquad \bar{y}(T) = G\bar{x}(T), \end{cases}$$

◆□▶ ◆□▶ ◆ □▶ ◆ □▶ ○ □ ○ ○ ○

To decouple, we set

$$\bar{y}(t)=P(t)\bar{x}(t).$$

◆□ ▶ < 圖 ▶ < 圖 ▶ < 圖 ▶ < 圖 • 의 Q @</p>

To decouple, we set

$$\bar{y}(t) = P(t)\bar{x}(t).$$

Then by assuming everything is fine, we have

$$\begin{aligned} -A^{\top} P(t) \bar{x}(t) - Q \bar{x}(t) &= \dot{y}(t) \\ &= \dot{P}(t) \bar{x}(t) + P(t) [A \bar{x}(t) - B R^{-1} B^{\top} P(t) \bar{x}(t)] \\ &= \left[\dot{P}(t) + P(t) A - P(t) B R^{-1} B^{\top} P(t) \right] \bar{x}(t). \end{aligned}$$

To decouple, we set

$$\bar{y}(t) = P(t)\bar{x}(t).$$

Then by assuming everything is fine, we have

$$\begin{aligned} -A^{\top} P(t) \bar{x}(t) - Q \bar{x}(t) &= \dot{y}(t) \\ &= \dot{P}(t) \bar{x}(t) + P(t) [A \bar{x}(t) - B R^{-1} B^{\top} P(t) \bar{x}(t)] \\ &= \left[\dot{P}(t) + P(t) A - P(t) B R^{-1} B^{\top} P(t) \right] \bar{x}(t). \end{aligned}$$

Thus, $P(\cdot)$ should be the solution to the **Riccati** equation:

$$\begin{cases} \dot{P}(t) + P(t)A + A^{\top}P(t) - P(t)BR^{-1}B^{\top}P(t) + Q = 0, \\ t \in [0, T], \\ P(T) = G. \end{cases}$$
(14)

(ロ)、(型)、(E)、(E)、 E) の(の)

Consider the following general **FBSDE**:

$$\begin{cases} dX(t) = b(t, X(t), Y(t), Z(t))dt \\ +\sigma(t, X(t), Y(t))dW(t), \\ dY(t) = -g(t, X(t), Y(t), Z(t))dt + Z(t)dW(t), \\ X(0) = x, \qquad Y(T) = h(X(T)). \end{cases}$$
(15)

Consider the following general **FBSDE**:

$$\begin{cases} dX(t) = b(t, X(t), Y(t), Z(t))dt \\ +\sigma(t, X(t), Y(t))dW(t), \\ dY(t) = -g(t, X(t), Y(t), Z(t))dt + Z(t)dW(t), \\ X(0) = x, \qquad Y(T) = h(X(T)). \end{cases}$$
(15)

Let

$$Y(t) = \theta(t, X(t)).$$

Consider the following general **FBSDE**:

$$\begin{cases} dX(t) = b(t, X(t), Y(t), Z(t))dt \\ +\sigma(t, X(t), Y(t))dW(t), \\ dY(t) = -g(t, X(t), Y(t), Z(t))dt + Z(t)dW(t), \\ X(0) = x, \quad Y(T) = h(X(T)). \end{cases}$$
(15)

Let

$$Y(t)=\theta(t,X(t)).$$

Then by Itô's formula, for $i = 1, 2, \cdots, m$,

$$-g^{i}(t, X(t), \theta(t, X(t)), Z(t))dt + Z^{i}(t)dW(t) = dY^{i}(t)$$

$$= \left[\theta^{i}_{t}(t, X(t)) + \theta^{i}_{x}(t, X(t))b(t, X(t), \theta(t, X(t)), Z(t))\right]$$

$$+ \frac{1}{2} tr \left[\theta^{i}_{xx}(t, X(t))(\sigma\sigma^{\top})(t, X(t), \theta(t, X(t)))\right]dt$$

$$+ \theta^{i}_{x}(t, X(t))\sigma(t, X(t), \theta(t, X(t)))dW(t).$$

Hence, if $\theta(\cdot, \cdot)$ is a right choice, we should have

$$Z(t) = heta_{x}(t, X(t))\sigma(t, X(t), \theta(t, X(t))),$$

which suggests:

$$z = p\sigma(t, x, \theta). \tag{16}$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 = のへで

Here p will be the row vector, generically representing θ_{x} .

Hence, if $\theta(\cdot, \cdot)$ is a right choice, we should have

$$Z(t) = heta_{\mathsf{X}}(t, X(t))\sigma(t, X(t), \theta(t, X(t))),$$

which suggests:

$$z = p\sigma(t, x, \theta). \tag{16}$$

Black's Conjecture: There should be an analytic relationship between the consol rate and the short rate.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

June of 1992, IMA.

Black's Conjecture: There should be an analytic relationship between the consol rate and the short rate.

The mathematical formulation of *infinite-horizon consol rate* problem:

Problem (IHCR) Find an adapted, locally square-integrable process (X, Y) such that

$$\begin{cases} X(t) = x + \int_0^t b(X(s), Y(s)) ds + \int_0^t \sigma(X(s), Y(s)) dW(s), \\ Y(t) = \mathbb{E} \Big[\int_t^\infty \exp\left(-\int_t^s h(X(r)) dr \right) ds \mid \mathcal{F}_t \Big], \\ t \in [0, \infty). \end{cases}$$
(21)

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

The above system is equivalent to the following FBSDE:

$$\begin{cases} dX(t) = b(X(t), Y(t))dt + \sigma(X(t), Y(t))dW(t), & t \in [0, \infty), \\ dY(t) = [h(X(t))Y(t) - 1]dt + \langle Z(t), dW(t) \rangle, & t \in [0, \infty), \\ X(0) = x, & Y(t) \text{ is uniformly bounded.} \end{cases}$$
(22)

◆□ ▶ < 圖 ▶ < 圖 ▶ < 圖 ▶ < 圖 • 의 Q @</p>

This is an FBSDE in an infinite horizon.

Theorem (Duffie–Ma–Y). Under proper conditions. Problem (IHCR) admits at least one nodal solution $(X(\cdot), Y(\cdot))$. In other words, there is a C^2 bounded function $\theta(\cdot)$ so that $X(\cdot), Y(\cdot)$) solves (21) and

$$Y(t) = \theta(X(t)).$$

Moreover, nodal solution is unique.

5. BSPDEs

$$\begin{cases} X(t) = x + \int_0^t b(s, X(s), Y(s), Z(s)) ds \\ + \int_0^t \sigma(s, X(s), Y(s)) dW(s), \end{cases}$$

$$Y(t) = h(X(T)) + \int_t^T g(s, X(s), Y(s), Z(s)) ds \\ - \int_t^T Z(s) dW(s). \end{cases}$$
(23)

In the above, all the involved functions are random fields.

Try to write Y(t) = u(t, X(t)), for some random field $u(\cdot, \cdot)$.

Suppose

$$du(t,x) = p(t,x)dt + \langle q(t,x), dW(t) \rangle, \quad (t,x) \in [0,T] \times \mathbb{R}^n,$$
(24)

with $p(\cdot, \cdot)$ and $q(\cdot, \cdot)$ undetermined. Then by a generalized Itô-Ventzell formula, we have

$$\begin{split} u(t,X(t)) &= u(T,X(T)) - \int_t^T \Big\{ p(s,X(s)) \\ &+ u_x(s,X(s))b(s,X(s),Y(s),Z(s)) \\ &+ \frac{1}{2} \mathrm{tr} \left[u_{xx}(s,X(s))\sigma(s,X(s),Y(s))\sigma(s,X(s),Y(s))^\top \right] \\ &+ \mathrm{tr} \left[q_x(s,X(s))\sigma(s,X(s)) \right] \Big\} ds \\ &- \int_t^T \Big(q(s,X(s))^\top + u_x(s,X(s)))\sigma(s,X(s),Y(s)) \Big) dW(s). \end{split}$$

We choose (u, q) so that

$$Y(t)=u(t,X(t)).$$

Then

$$\begin{split} &Z(t) = q(t, X(t))^{\top} + u_{x}(t, X(t))\sigma(t, X(t), u(t, X(t))), \\ &g(t, X(t), Y(t), Z(t))) \\ &= -\Big\{p(t, X(t)) + u_{x}(t, X(t))b(t, X(t), Y(t), Z(s)) \\ &+ \frac{1}{2} \text{tr} \left[u_{xx}(s, X(s))\sigma(s, X(s), Y(s))\sigma(s, X(s), Y(s))^{\top}\right] \\ &+ \text{tr} \left[q_{x}(s, X(s))\sigma(s, X(s))\right]\Big\}. \end{split}$$

◆□ ▶ < 圖 ▶ < 圖 ▶ < 圖 ▶ < 圖 • 의 Q @</p>

Thus, we need to solve BSPDE:

$$\begin{aligned} du(t,x) + \left\{ \frac{1}{2} \operatorname{tr} \left[u_{xx}(t,x)\sigma(t,x,u(t,x))\sigma(t,x,u(t,x))^{\top} \right] \\ + u_{x}(t,x)b(t,x,u(t,x),q(t,x)^{\top} + u_{x}(t,x)\sigma(t,x,u(t,x))) \\ + \operatorname{tr} \left[q_{x}(t,x)\sigma(t,x,u(t,x)) \right] \\ + g(t,x,u(t,x),q(t,x)^{\top} + u_{x}(t,x)\sigma(t,x,u(t,x))) \right\} dt \\ - \left\langle q(t,x),dW(t) \right\rangle = 0, \end{aligned}$$
(25)

If the above BSPDE admits a classical adapted solution (u, q), then we can try to solve the following FSDE:

$$\begin{cases} dX(t) = b(t, X(t), u(t, X(t)), \\ q(t, X(t)) + u_{x}(t, X(t))\sigma(t, X(t), u(t, X(t))))dt \\ +\sigma(t, X(t), u(t, X(t)))dW(t), \\ X(0) = x. \end{cases}$$
(26)

If this can also go through, we could finally set

$$\begin{cases} Y(t) = u(t, X(t)), \\ Z(t) = q(t, X(t)) + u_{X}(t, X(t))\sigma(t, X(t), u(t, X(t)). \end{cases}$$
(27)

▲□▶ ▲□▶ ▲三▶ ▲三▶ 三三 のへで

Hence, at least formally, we still have the following Four-Step Scheme:

Step 1. Define

 $z = q + p\sigma(t, x, y), \quad \forall (t, x, p, q) \in [0, T] \times \mathbb{R}^n \times \mathbb{R}^{1 \times d} \times \mathbb{R}^{1 \times n}.$

Step 2. Solve BSPDE (25).

Step 3. Solve FSDE (26).

Step 4. Set $Y(\cdot)$ and $Z(\cdot)$ by (27).

This motivated us to study BSPDEs. As a first step, we consider

$$u(t,x) = h(x) + \int_{t}^{T} \left\{ \nabla \cdot \left[A(s,x)u_{x}(s,x) \right] + u_{x}(s,x)a(s,x) + a_{0}(s,x)u(s,x) + \operatorname{tr} \left[B(s,x)q_{x}(s,x) \right] + \langle b_{0}(s,x),q(s,x) \rangle + g_{0}(s,x) \right\} ds$$

$$- \int_{t}^{T} q(s,x)dW(s), \qquad (28)$$

Theorem (Ma–Y). Under proper conditions, including

$$\begin{bmatrix} B(\partial_{x_i}B^{\top}) \end{bmatrix}^{\top} = B(\partial_{x_i}B^{\top}),$$

a.e. $(t, x) \in [0, T] \times \mathbb{R}^n$, a.s. $1 \le i \le n$. (29)

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

BSPDE (28) is well-posed.

• 2000, Ying Hu (of Université de Rennes 1, Frances) joined Jin and myself, working on one-dimensional semilinear BSPDEs.

• 2012, Ma-Yin-Zhang, established the equivalence of the well-posedness of random coefficient FBSDEs and the existence of the so-called random decoupling field, via the solution of BSPDEs.

- 2013, Du-Tang-Zhang removed the technical condition (29).
- 2013, Du-Zhang studied multi-dimensional semilinear case.
- 2014, Du–Chen studied BSPDEs, allowing quadratic growth of (u_x, q) in the semilinear term.

• For the general BSPDEs, it seems to be still open for the cases that the differential operators \mathcal{L} and \mathcal{M} are nonlinear in u and/or in q.
In about 1997, Jin and I decided to write a book summarizing the updated theory of FBSDEs. The book was published in 1999.
